# **KONTROL PANELİ**

Stm32f407vgt6 discovery board ile UART haberleşmesi yapılmaktadır. HC-SR04 ile mesafe ölçümü yapılıp ölçülen değeri bilgisayara göndererek bilgisayarın mikrodenetleyiciye komut göndermesi planlanmıştır. Ölçülen mesafe değerine göre 3 adet led belirli değer aralıkları için yanmaktadır ve 4 digit display üzerinden mesafe kullanıcıya gösterilmektedir.

Python PyQt5 ile bir kullanıcı arayüzü tasarlanıp bu arayüzden veri akışı kontrol edilmektedir. Yine python ile port okuması ve port üzerinden veri göndermesi yapılmaktadır.

# Kullanıcı arayüzü

Main kodu

```
def gonder(self):

gonder(len = self.ul.lineEdit.text() + "." # verinin somma . koyan, sta2'in verinin bittiğini anlaması için
self.ser.write(gonderllen.encode('utf-8')) # pent üzerinden veriyl gönderin
print('Verl gonderlidi: " + str(gonderllen)) # terminale yazar

def oto(self): # veri alış verisini otomatik yapar

while('True):
self.ser.reset_input_buffer()
gelen = self.ser.resetlinput_buffer()
gelen = self.ser.realline().decode('utf-8').strip() # porttan gelen veriyi okur
self.ul.abeb..settrac(tre(gelen)) # terminale yazar

print('Gelen veri: " + str(gelen)) # terminale yazar

gonderllen = gelen + "." # gelen veriyi nottalar

print('Teve gonderlidi: " + str(golerllen)) # terminale yazar

print('Teve gonderlidi: " + str(golerllen)) # port üzerinden veriyi gönderler

print('Teve gonderlidi: " + str(gonderlien)) # terminale yazar

time.sleep(0:3) # Poytts uygulamasını baslatma

win = pencere() # Ana pencerenin bir örneğini oluşturma

win.show() # main window gösterme
app.exec_() # Uygulamasını baslatma

win.show() # main window gösterme
app.exec_() # Uygulamasını baslatma

win.show() # main window gösterme
app.exec_() # Uygulamasını baslatma
```
